

Why the KISS System?

The KISS System removes the subjectiveness in wound photography to address sources of liability

The KISS System standardizes the wound photo regardless the skill of the photographer with a camera

Universal scaling

- Area, perimeter, length and width

360 degree scaling

- Addresses the curvature of the body keeping the wound in perspective.
- Demonstrates if the wound is growing or shrinking from one assessment to the next.
- Proves wound size for reimbursement.
- Minimizes the subjectiveness for an investigator to say the wound is larger than it is.

Adhesive labels

- Conform to the curvature of the body.
- Scales guide in the same plane as the wound.
- Eliminates the need for two nurses, one to hold the ruler and the other to take the picture.

Color-coding

- Addresses distance from camera issues so that a wound can not be made to look bigger or smaller.
- Acts as a backup to the large numerics use on the photo guides

Stick Figure

- Aligns the wound to the body so that the documentation demonstrates the 12 and 6 o'clock direction.

Enhanced Communication

- Placing the ring around the wound is like placing a clock around the wound. Tunneling or undermining can be documented by saying "2 cm at 3 o'clock". Everyone will know where to find the tunneling.

Discourages Manipulation

- Very difficult to crop a photo and blow up as a presentation to a jury.
